Google sheet filter multiple values. What is a filter view in google sheets. Google sheets how to filter multiple columns. Google sheets filter multiple ranges.

When you're analyzing complex data sets in Google Sheets, you can take advantage of its built-in sorting feature to organize the data. You can sort by multiple columns. To do this, you'll need to open your Google Sheets spreadsheet and select the data set you wish to sort. You can do this manually by selecting the cells using your mouse, or by selecting one of the cells in your data is selected, click Data > Sort Range from the Google Sheets menu. In the "Sort Range" option box, you can select how you wish to sort your data. You can select the column to sort by, as well as whether to sort in ascending or descending or desce by multiple columns in Google Sheets, the sort will take place in order from top to bottom. For instance, an example spreadsheet has product names, sale dates, and prices shown. If you wanted to sort this data by name and then by the amount sold, you'd want to select the product name column in column A (named "Product") first and the amount sold in column C (named "Price") second. You could sort this in ascending order, starting with product names near the start of the alphabet at the top, then with prices sorted by the smallest amount. Select "A-Z" to sort this way or "Z-A" to sort in descending order instead. You can mix and match these options, too. For this example, you could sort in ascending order for product names and descending order for sales amounts. Once your sorting options are set, select the "Sort Range" options box. For this example, the data above has been sorted with product names and prices both in ascending order. This is shown clearly with the monitor and mouse products. Priced at \$100, the monitor would come second if the sort was performed on the "Price" column (column C). As the sort was performed on the "Price" column (column A) first, however, the sold monitor was placed ahead of the mouse. You can undo any of these sorts by performing another sort on your data set, by pressing the "Undo" button in the menu bar, or by pressing Ctrl+Z on your keyboard. RELATED: All the Best Google Sheets, I want to filter view my results so only rows with an "x" in column D AND/OR column E are shown. If I filter to show the columns with an "x" in them, it will only show rows with an "x" in column D AND column E. How do I make it do AND/OR? When I click the filter button in the column it just asks me to select which entries I want to show. 2 The following step-by-step example shows how to filter multiple columns in Google Sheets. Step 1: Enter the Data First, let's enter the following data that shows the total sales of certain products in certain regions for a company: Step 2: Apply Filter to Multiple Columns Now suppose we'd like to filter for rows where the Region is "East" or the Product is "A." To do so, click cell A1 and then click the Data tab and then click the Filter icon next. to Region and then click Filter by condition. In the dropdown menu, click None and then scroll down to Custom formula is and type in the following formula is and type in the following formula: =OR(A:A="East", B:B="A") Once you click OK, the data will be filtered to only show rows where the Region is East or w East and the Product is A, you can use the following formula: =AND(A:A="East", B:B="A") Once you click OK, the data will be filtered to only show rows where the Region is East and where the Google Sheets How to Use SUMIF with Multiple Columns in Excel and Google Sheets In this article, you will learn how to apply multiple filters to columns in Excel, you can filter the data by multiple columns at once. Say you have the data table shown below. To filter data first by Month (display on Feb-21), and then by Total Sales (greater than \$400), follow these steps: 1. To display filter buttons in the column headings, select any cell in the data range (e.g., B2:G16), and in the Ribbon, go to Home > Sort & Filter. Now every column heading has a filter button and can be used to filter the table data. 2. Now, click on the filter button for Month (cell D2), select only February (uncheck January), and click OK. The filter functionality recognizes dates and groups them by year and month. As a result of Step 2, all rows containing Jan-21 in Column D are filtered out, and only those with Feb-21 are displayed. Also, the appearance of the filter button for Total Sales (G2), select Number Filters, and click Greater Than. Note that you could also choose Equals, Does Not Equal, Less Than, etc. 4. In the pop-up window, enter the lower limit (in this case, \$400) and click OK. Here you could also add more conditions or change the operator. The final result is the original data range filtered by Month (Feb-21) and by Total Sales (greater than \$400). Apply Multiple Filters to Columns in Google Sheets 1. To create filter buttons, select any cell in the data range (B2:G16) and in the Menu, go to Data > Create a filter. 2. Click on the filter button for Month (D2), choose only Feb-21 (uncheck Jan-21), and click OK. Now the data range is filtered by Month, and only rows with Feb-21 are displayed while all other rows are hidden. Also, the filter button has a new appearance, so it's clear there is an active filter on Month. 3. Click on the filter button for Total Sales (G2), select Filter by condition and from the drop-down menu, choose Creater than. As in Excel, you could alternatively choose Less than, Equal, etc. 4. In the text box that appears under the Greater than condition, enter a lower limit (400), and click OK. Finally, rows containing Feb-21 in Column D with a sales value greater than \$400 are displayed, and other rows are hidden. This post explains how to select all or a specific category in multiple columns using the Filter function in Google Sheets. In Google Sheets, there are three options to perform a filter, one of the most common tasks we do in Spreadsheets. They are; Two menu commands in the DATA menu. They are Create a filter or Filter views > Create new filter view.FILTER function. QUERY function. In this tutorial, we are going to learn to use the Filter function to select all or specific category values in multiple columns in Google Sheets. If you prefer the Data menu, you can easily do it as follows. Assume the data is in A1:C, where columns A, B, and C contain Items (text field), and Stock (numeric field), respectively. Steps: Select A1:C.Click Data > Create a filter. If you want to filter all the items from "Supplier 1," click on cell B1 down arrow and uncheck all the values except "Supplier 1." Columns A and C - Set to select all (default).Column B -Set to a specific category, i.e., Supplier 1. If you prefer, you can show the "Stock" equal to or greater than and type 500 in the given field. To revert to select all in column B, click cell B1 (down arrow) > Select all (link). How to select all or a specific category in multiple columns using the Filter function in Google Sheets? Let's learn that below. Get Select All in Multiple Columns in Filter Function Follow the below steps to select all or specific categories in multiple columns in the Filter function in Google Sheets. There are two main steps and they are the drop-down part and the formula part. 1. Drop-Down Part As per our sample data, we require to create three drop-down menus for columns A, B, and C and all should contain the option "All" in addition option in Google Sheets. Here is how. In cell E2 click Data > Data validation and select "List of items" against Criteria. There in the given field, copy-paste the below lists. Gravel 20-40 mm, Gravel 10-20 mm, All They are the unique items from column A and an "All" string. Similarly, create drop-downs in F2 and G2. List for use in F2; Supplier 1, Supplier 2, Supplier 3, Supplier 3, Supplier 4, All List for use in G2; 0, 500, 1000, All Note:- If you prefer to use the "List from a range" against Criteria in the Data validation, then please follow this guide - How to Get an All Selection Option in a Drop-down. 2. Formula Part - Filter Function and Select All in Multiple Columns In cell E4, insert the following formula.

=filter(A2:C,if(E2="All",row(A2:A),A2:A=E2),if(F2="All",row(B2:B),B2:B=F2),if(G2="All",row(C2:C),C2:C>=G2)) How does this formula be able to filter all or selected category values from each column? For example, we use the following plain Filter formula to filter based on specific conditions in columns A, B, and C. =filter(A2:C,A2:A=E2,B2:B=F2,C2:C>=G2) To see it working, choose "Gravel 10-20 mm" in E2, "Supplier 2" in F2, and 500 in G2. You will get the rows matching the above conditions. The "All" in the drop-downs are not a criterion in columns A, B, and C. But the Filter function will treat it so! So in our 'original' formula, I have used three IF logical tests to make them correctly 'readable' to the Filter function. For example, the highlighted part in if(E2="All",row(A2:A),A2:A=E2) tests whether the E2 value is "All" or not. If it's "All," the filter criterion in columns A is row(A2:A), and if not, A2:A=E2. You may doubt whether row(A2:A) is a condition in Filter. Yep! It defines a condition similar to len(A2:A). The difference is as follows. row(A2:A) – It means have row numbers. len(A2:A) – It means whether the rows have values or not. I prefer the former to get select all in columns in Filter. If you want select all but exclude blank cells in that column, use the latter. Example Sheet 22422 That's all. Thanks for the stay. Enjoy! Resources
