

Function machine input output

1 2 14 8 + 6 FUNCTION MACHINES This is a function machine: Input output This then gives us the output We place a number in the input (= 14) The number then moves along ... 3 = output Input + 6 + 6 b c Writing expressions from FUNCTION MACHINESWe can express these function machines as a number sentence. These rules are known as algebraic expressions.... In Maths, we use letters from the alphabet to represent numbers... These function machines can be used for any number that is placed into the input ... Input output = output Input + 6 + 6 b c ... and instead of writing output we could use a different letter So instead of writing 'input', we can use a letter - let's use 'b' $4 + 4 \ge b \ge 2 + 4 = c$ bis 5 Algebraic expressions - Substitution !Here we have an algebraic expression b x = c At the moment, we do not know what number b (the input) is, and therefore we do not know what c (the output) is So we need some more information If it were drawn as a function machine, it would look like this... Input output x 2 + 4 5 This is called substitutionAlgebraic expressions - SubstitutionAlgebraic expressions b with 5. $+ 4 = c \ 10 = c \ This$ is called substitution 6.2 x b = c 2 x b = c Algebraic expressions - multiplication Symbol ... 2 x b = c Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication Symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication Symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 c = d 4.x c = d Algebraic expressions - multiplication symbol ... 2 x b = c 7.4 multiplicationSo when we see an expression like this... 4c = d 4 x c = d 1t is the same as... A function machine takes an input, and based on some rule produces an output. The tables below show some input-output pairs for different functions. For each table, describe a function rule in words that would produce the given outputs from the corresponding inputs. Then fill in the rest of the table values as inputs and outputs which are consistent with that rule. Input values can be any English word. Output values can be any English alphabet. \$\\\\\ \$ input cat house you stem \$\\\\\ \$ output t e u z Input values can be any rational number. Output values can be any English alphabet. be any rational number. input \$2, 55, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, 0, -1.53, -1.month of the year. input 25 365 35 95 330 66 output January December February April November \$\\\\\\\ \$ October For at least one of the tables, describe a second rule which fits the given pairs but ultimately produces different pairs than the first rule for the rest of the table. The purpose of this task is to connect the a function described by a verbal rule with corresponding values in a table (one of six connections to be made between the four ways to represent a function, the other two being through its graph and through an expression). It also encourages students to think more broadly about functions as relating objects other than numbers, although this broad application is not intended to be assessed. Because of its ambiguity, this task would be more suitable for use in a classroom than for assessment. Teachers should scrutinize similar tasks with care. Sometimes such tasks are presented without asking the rule, which is a main purpose for the task, or acknowledging the possibility for multiple possible table values, which would be mathematically incorrect. This task can provide an opportunity to discuss predicting sea levels), as well as the nature of scientific extrapolation and inductive reasoning versus mathematical deductive reasoning. This task can be modified to be played as a game where the instructor has a chosen rule and then gives input-output pairs one by one, and students have to try to guess the rule. Students who think they have found the rule could either describe it, or perhaps supply input-output pairs which follow the rule they are guessing. The act of guessing what someone is thinking is not really mathematics, but mirrors the process one often goes through when modeling with mathematics. What is needed in either case is an analysis of whether the chosen rule is appropriate and whether there are other reasonable rules. For examples such as in the first part, a question might come up along the lines of "Could we define a function using other letters. But to do something like "take the first letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third letter, "when some words don't have a third letter," when some words don't have a third l from which the input is taken can be modified to be words with at least three letters. Or we can add an element to the output set to indicate such a "null letter"). Or one can modify the rule to, for example, use the last letter for words with fewer than three letters. There's no mathematical reason to prefer any of these, but modeling situations would often point to one or the other. For example, in Scrabble every word has at least two letters, so a second-letter function would be well-defined there. The task brings to mind one function which is of more value as a brain teaser than of mathematical value. It takes as input positive integers and has as output the number of letters in its (American) English spelling, so the first few values are \$3,3,5,4,4,3,5,\ldots\$. We can notice that the letters provided as input, so one possible rule is "take the last letters" of the input. Below is one possible values are \$3,3,5,4,4,3,5,\ldots\$. consistent with this rule. input cat house you stem buzz sky picture output t e u m z y e We can notice that the output and input pairs given all differ by five, so one possible rule is "add 5" to the input value. Below is one possible way to complete the table consistent with this rule. input 2 5 -1.5 0 -4 3 0.1113 output 7 10 3.5 5 1 8 5.1113 The numbers seem to be "switching places" in a way. One possible precise rule could be that the output for an odd number is the even number which is one less. Below is how to complete the table consistent with this rule. input 1 2 3 4 5 6 7 output 2 1 4 3 6 5 8 One possible rule here is "the month in which the input day of the year falls", defining January 1st to be day one. To be precise, we specify that we are using a non-leap year to determine the output values. Below is one possible way to complete the table consistent with this rule. input 25 365 35 95 330 66 280 output January December February April November March October Mathematically, any of these tables could be fit by an unlimited number of rules. For (c), we could instead choose the rule to produce the values "divide by 2 then multiply by 4". That is, starting at f(1) = 2 we have f(n+1) = f(n)/2 if n is odd and $f(n+1) = 4 \ f(n)/2$ if n is even. (Such a definition would be aligned with F-IF.3, and is conceivable as a student answer in its less formal description.) This gives a different value for \$f(5)\$ than the rule would be to use a leap year as the basis for the rule. In this case for example \$f(60)\$ would differ from the value given by the rule provided. Page 2 Loading... I recently helped with a lesson that involved using input/output machines to 5th graders. To help students visualize these machines that transform shapes into circles to make the idea of the machines more tangible. Then, it switches to math and aligns with some of the first problems in the student work packets for the grade 5 CT lesson. This video can be used in conjunction with the lesson described below or on its own to introduce IO machines and/or functions in programming in a way that is accessible to elementary school students. Video Lesson I've been working with the math coach at my school to incorporate computer science/ computational thinking into elementary school math lessons. One set of lessons, modules, and activities to incorporate computational thinking into existing lessons that align with Massachusetts math and science standards. At the time of this writing, the materials are still under development and may change. We did a modified version of the Grade 5 Math - Number Fluency and Fractions module. In this module, students use two-step input/output machines as a technique to multiply whole numbers by fractions. For example, can also be expressed as . We can envision the multiplication and division as two input/output machines, demonstrating different kinds of algorithms. The lesson plans call for these machines to teach students about algorithms, which help develop computational thinking. They can also set students up to think in terms of functions. In computer science, functions are used to run the same step or steps multiple times without having to define them each time. The function is defined once and called (or run) as many times as necessary. In my experience working with first-time coders in middle and high school, functions, and input/output machines are the perfect way to do so.
