Can i disable android accessibility suite. What is android accessibility suite and do i need it. Is it safe to uninstall android accessibility suite. Can i uninstall android accessibility suite. Can you uninstall android accessibility suite. What happens if i uninstall android accessibility suite.

There are so many apps out there for Android devices, many of them free, that you can't help installing a bunch of them. However, you might discover you don't like some of them, or you're starting to run out of room on your device. Update: The Android interface has evolved tremendously since this article was originally published. Here's an updated guide on how to how to uninstall, delete, and disable Android apps from your smartphone or tablet. RELATED: How to Uninstall Android Apps From Your Smartphone or Tablet Uninstalling apps is easy on Android devices. We will show you three simple methods for uninstalling apps in Android. Uninstall an App Using the App Drawer/App Tray To uninstall an app using the App Drawer, or App Tray, touch the Launcher button in the Apps Dock at the bottom of the screen (in Portrait mode) or on the right side of the screen (in Landscape mode). Swipe until you reach the screen that shows the app you want to uninstall. Touch and hold the icon for the app and then drag it to the trash can icon on the main screen. A confirmation dialog box displays asking if you want to uninstall the app. Touch OK. Uninstall an App Using the Application Manager You can also uninstall an app in the Settings using the properties screen for the app in the Application Manager. To do so, swipe down in the upper-right corner of the navigation/status bar and touch Settings. NOTE: If you own a Samsung Galaxy S series device or Galaxy tablet, there is a slightly different method for accessing the properties of an app. We discuss how to access this screen in our article about force stopping apps in Android. On the Settings screen, touch Apps under Device. A list of downloaded apps displays. You can also view different lists of apps depending on where the app is installed or what state it's currently in, such as apps installed on the SD card (if the device has one), a list of running apps, and a list of all apps. Find the app you want to uninstall in the list and touch it. The App info screen displays. Touch the Uninstall button. A confirmation dialog box displays asking if you want to uninstall the app. Touch OK. The app is removed from the list. Uninstall an App Using the Google Play Store The Google Play store knows which apps you have bought (whether paid or free) and whether they are installed or not. To uninstall an app, you can go to the Google Play store page for the app and touch the Uninstall button. A confirmation dialog box displays asking if you want to uninstall the app. Touch OK. Once the app is uninstalled in the Play store, you are returned to the app's page and the Install button is available. Touch the Home button to return to the Home screen. I have one question: why do you have so many apps installed on your Android TV? You know, like that all those things you installed "just to try out," then never used again? Yeah, that stuff. It's about time you cleaned up that little set-top box of yours, that way you can make room for new stuff that you'll only use once. It's a vicious circle. There are actually a couple of different ways to go about uninstalling apps on Android TV. Fortunately, we've got you covered on both. Let's do this thing. How to Uninstall Apps Directly from the Launcher As of Android 6.0, you can not only arrange how your apps are presented on the launcher, but also uninstall them quickly and easily. The first thing you'll want to do is navigate to the app you'd like to uninstall, then long-press it using the select button on your remote. When the screen background turns gray, you're in the "edit" menu. At the bottom, there's a trash can—just move the app to that can, then press the select button. This will transfer you in to the "Uninstall app" menu. Select "OK" to completely remove the app from your device. Once it's finished, you'll be back in the home screen layout edit menu, where you can either continue uninstalling applications you no longer want, or exit completely. How to Uninstall Apps from the Settings Menu While this method also works on Android 6.0, it's the only way apps can be uninstalled on Android TV 5.x. First, head into the Settings menu by scrolling to the bottom of the home screen and selecting the cog icon. From there, scroll over until you see "Settings & reset," then choose that. In this menu, there are a couple of options: "Internal storage" and "Factory data reset." You want the former. This menu will break down everything that's taking up space on your Android TV box, but we're only interested in the first option here: "Apps." Select that. The section is broken down into a few categories, but the one you're most interested in is "Downloaded apps." This includes all the apps that you've installed on your box, both from the Play Store and ones you've sideloaded. Scroll over till you find whichever one you want to uninstall, then select it. A new menu with

several options will open—just scroll down to “Uninstall” and select that. The Uninstall menu will now open—select “OK” to completely remove the app. That’s it, you’re done. While slightly convoluted, it should be, as uninstalling on Android 5.x is still a relatively simple process. It’s even easier once your device is updated to 6.0 (or the upcoming Android N). The good news is that you’ll be back to binge watching Netflix and eating Doritos in no time, regardless of which method you have to (or choose to) use. Apple users are able to store their notes, pictures, contacts, and settings in their iCloud storage and sync them across multiple Apple devices. Accessing your iCloud data on Android is a trickier process, but it is possible. Here’s how: First, you’ll need to be aware of the limitations. Apple, by design, doesn’t generally play well with other non-Apple devices. You can easily use iCloud on Mac, iPhone, or iPad, but you won’t see an official Android app for iCloud appearing anytime soon. Using iCloud Online on Android The only supported way to access your iCloud services on Android is to use the iCloud website. Your access is still quite limited—initially, you will have access only to your saved photos and notes, as well as the “Find iPhone” service. To start, head to the iCloud website on your Android device and sign in using your Apple ID and password. If you’ve set up two-factor authentication on your iCloud account, you might need a macOS, iOS, or iPadOS device attached to your account to receive a code that allows you to sign in. Type in the code that appears on your Apple device during the sign-in process on Android, if this is the case. The iCloud website will ask you if you trust the browser you’re using to sign in. If the device is yours, press the “Trust” button—you won’t need to provide a six-digit code from another iOS, iPadOS, or macOS device to sign in again. Otherwise, tap “Don’t Trust” or “Not Now” to proceed without trusting the device. Using iCloud Photos, Notes, and Find iPhone on Android If your sign-in details are correct, you should see the (fairly limited) iCloud dashboard on Android. You can tap “Account Settings” to access your Apple account settings or select one of the three icons listed to access the Notes, Photos, or Find iPhone services. These are the only services that Apple allows you to easily view on your Android device using a mobile browser. Accessing iCloud Photos Pressing the “Photos” icon will bring up your saved iCloud photos. You can tap the “Upload” button to upload new photos. Select any of the items to view or delete them from your iCloud storage or to download them as local files onto your Android device. Accessing iCloud Notes Pressing the “Notes” icon will show your saved iCloud notes. As with iCloud Photos, this section has been optimized for mobile viewing. You can view, edit, and delete your existing notes, or tap the “Add” button in the top-left corner to create a new note. Using Find iPhone on Android The last service you can easily access on Android using the iCloud website is the Find iPhone service. Tap the “Find iPhone” icon on the main iCloud dashboard to begin. You might need to re-enter your Apple account password and provide a six-digit authentication code at this stage. Once confirmed, a list of Apple devices (including iOS, iPadOS, and macOS devices) attached to your account will be displayed. Tap any of the devices listed to see where they were last seen and if they’re currently active. Press the “Play Sound” button to locate the device or “Erase iPhone,” “Erase iPad,” or “Erase Mac” to remotely wipe the device. You can also use the Lost Mode feature to display a message on your Apple device’s screen if you’ve lost the device. RELATED: What Is “Lost Mode” on the iPhone, iPad, or Mac? Press the “Lost Mode” button to do this. Using Other iCloud Services on Android Although you can access some iCloud services in third-party apps, these apps aren’t official and their quality and success in accessing iCloud will vary. The easiest service to access is your iCloud email account. You can set up iCloud email access on Android using Gmail or another email app. This will allow you to send and receive emails from your iCloud email account using your Android device. RELATED: How to Set Up iCloud Email Access on Android Other services can be accessed through the iCloud website, but you’ll need to switch to your browser’s desktop mode feature to view them. We won’t sugarcoat it, this isn’t the easiest way to view your iCloud calendar or contacts, even if you have a large mobile display. It should still work, but don’t expect the same user experience that you’ll find on an iOS or iPadOS device. To use these iCloud services on Android, sign in to the iCloud website using Chrome for Android. Once you’ve signed in, tap the hamburger menu icon in the top-right corner and then select the “Desktop Site” checkbox. This will cancel the mobile page and load the equivalent desktop version of the iCloud website. The full range of iCloud services will appear, although the page will be harder to read. You might want to switch to landscape mode on your Android device for better navigation at this point. From here, tap any of the services to access them. Tapping “Reminders” will load a list of your saved iCloud reminders, for instance. Because this isn’t a supported view mode, the functionality of these services on Android might vary. Navigating these services will be tricky, but you should be able to use this view mode to access your saved contacts, calendar, and iCloud Drive file storage. Other services like Pages and Numbers should technically load and allow you to view files, but they won’t be useable in any meaningful way. Installing iCloud as a Progressive Web App on Android If you want to use your iCloud services on Android regularly, it might be worth adding it to your home screen as a progressive web app (PWA). This allows you to open the iCloud page like a “real” app, without needing to open Chrome first. To do this, head to the iCloud website in your Android Chrome browser. Tap the hamburger menu icon in the top-right corner and then select the “Add to Home Screen” option. You’ll need to give your iCloud PWA a suitable name. Use the default “iCloud” name or rename it and then tap the “Add” button to confirm. You’ll then need to long-press and drag the icon that appears to your home screen, placing it wherever fits best for you. Your onscreen instructions might vary, depending on your version of Android. Alternatively, tap the “Add” button for the app to be placed on your home screen automatically. This will add the iCloud icon to your Android home screen. Tapping this icon will load iCloud in an entirely isolated app-like environment. You won’t be able to switch to desktop mode using a PWA, so you’ll be limited to accessing your iCloud photos, notes, and Find iPhone services. We’ve covered the list of possible iCloud services you can access on Android, but some are beyond reach. You can’t use iMessage on Android at all, nor is it possible to use Apple AirDrop on Android. RELATED: Can You Use iMessage on a Windows PC or Android Phone? You’ll need to use cross-platform alternatives like WhatsApp and Snapdrop as a replacement for these services.
