Blue SM-N980F, SM-N980F, SM-N980F/DS SAR 1.11 W 1.1 animals. Phone phones with the latest processors, a large amount of RAM and beautiful screen. And their cameras are fantastic. But both are quite expensive ... Maybe you are looking for offers in the carrier or partner? Note 20 has a lower display. In note 20, Ultranote has 20 plastic rear pencil: a response time of 25 ms in class 20, 9 ms in class 20 Ultra, of course a 6.9 -inch customs screen. But their proportions are also a bit different. In Galaxy Note 20 we get 20: 9 aspect ratio, while Ultras 19.3: 9. This means that the Galaxy Note 20 is just slightly smaller and narrower, but there is still a pretty big phone. Regarding the solution of remarks 20, Ultra is obviously sharper of the two. Galaxy Note 20 Ultra has an advertisement of 1440 x 3200 WOHD and Note 20 has a FHD+1080 x 2400 panel. On the habits there are 511 pixels in note 20. What do these numbers mean in the real world? Simply put, you will not see a big difference between them with pixels. But purists will always want the sharpest picture. However, it can only be turned on if the phone is set to 1080p. You will probably continue and sacrifice other pixels at 120 Hz, which is definitely smoother and more beautiful than 60 Hz. To be honest, we are a little disappointed that Samsung has blocked a small mark 20 at 60 Hz. I learned that there were almost no compromises in terms of internal elements. Note 20, as well as larger siblings Snapdragon 865+ (or Exynos 990 on the international scene), is powered. The differences relate to the level of RAM, no matter what option you choose. Note 20 Ultra has up to 12 GB of RAM. Depending on where you live in the world, a degree of 128 GB or 256 GB of memory can have a capacity of 128 GB to 256 GB and even 512 GB. Note 20 lltra has 128 GB/8 GB. Note 20 lltra has 128 GB/12 GB/12 GB. Note 20 lltra has 128 GB/12 GB give you a day of battery life - nothing to slow you down, but reliable enough. But both also support 25W fast charging, so you can quickly top up when it's maxed out. Also, only the Galaxy Note 20 Ultra has a microSD card slot for memory expansion, the Note 20 does not. There are glaring differences when it comes to the specs of the camera. In fact, they are very similar to the camera differences between the S20 Ultra and the S20. The Galaxy Note 20 Ultra features a super-dense 108-megapixel telephoto camera, and a 12-megapixel sensor on the main camera, and a 12-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the main camera, and a super-dense 108-megapixel sensor on the sen went 100 times on the S20 Ultra. We're guessing it's been toned down on the Note 20 Ultra so Samsung can focus more on quality than shock numbers. The Galaxy Note 20 has a 12MP main camera, a 12MP ultra-wide angle, and a 64MP "telephoto" camera. This is in quotes because Samsung is slowly realizing the telephoto effect via 3x Hybrid (supported by digital). The high resolution zoom is up to 30x, phones released for a 1v1 comparison we thought they were both awesome the Note 20 Ultra looks washed out now) a regular Note 20 can only go up to 30x, but you probably won't do it often, so in that sense it supports 8K video at 24 fps. and both have the full manual modes you'd expect from the returning Galaxy Note 20 to its roots and having a completely flat screen. None of those "benefits" that Samsung has put on all of its phones. The Note 20 Ultra still has a curved display, so that's where you'll have to go if you want it. Cash would... but the Note 20 is not. The "cheaper" Note has "Glassic" construction - basically the back is plastic meant to look like glass. Of course, it's not the end of the world. But not what you'd expect from a \$1,000 phone. You can definitely feel the difference between the two phones. And the fact that the Note 20 still has a metal frame doesn't help. Again for each of them. Some people like that plastic doesn't shatter like glass. And some peopleone more flat screen - yes, "edge" screens look great, but ghost keys make them more common and distort content to the edge of the screen. In terms of design, the Note 20 looks more like the successor to the Note 10. Samsung introduced a 9ms response time for the S Pen stylus in the Galaxy Note 20 Ultra. Yes, no Ultra - Note 20. Gets a "40% speed boost" or 25ms response time for the smaller model. But you know what? The S Pen already felt great on the Galaxy Note 10, and it's hard for us to see a difference in performance between the Note 20 ultra. Relax, the S Pen stylus is great. The more we look at the specs, the more smartphone fans seem to want to skip the Note 20 ultra (here's our Note 20 ultra ( pretty disappointing because - in 2020 - there are phones that are much cheaper and can still hit at least 90Hz (ahem, OnePlus Nord). The plastic build is a disappointment, and there are power users who want to look beyond these dips just to get a slightly better rating. So which Notes is the phone for you? Buy the Galaxy Note 20 and Note 20 Ultra here
