We are providing instructors with a generic password that will work past this 6-month period of time under the condition that this password is not distributed by instructors to students or professionals. We appreciate your discretion. Exercises are sorted roughly by section, not difficulty. While some exercises are more difficult than others, none are intended to be endishly tricky. A few exercises notably, though not exclusively, the ones that involve calculating simple probabilities require a modest amount of mathematical background; most do not. There is a sidebar summarizing much of the applicable basic probability theory in Chapter 2. An occasional exercise is awkwardly or ambiguously worded in the text. This manual sometimes suggests better versions; also see the errata at the web site.

the chaff. One RTT after the handshaking we send two packets. Addresses also provide embedded routing information. Unlike typical network addresses, postal addresses are long and of variable length and contain a certain amount of redundant information. This last attribute makes them more tolerant of minor errors and inconsistencies. Telephone numbers are more similar to network addresses although phone numbers are nowadays apparently more like network host names than addresses they are geographically hierarchical, variable length, administratively assigned, and in more or less one-to-one correspondence with nodes. 10. One might want addresses to serve as locators, providing hints as to how data should be routed. One approach for this is to make addresses hierarchical. Another property might be administratively assigned, versus, say, the factory-assigned addresses used by Ethernet. Other address attributes that might be relevant are variable length v. fixed length, and absolute v. relative like IP names. 2 Chapter 1 If you phone a toll-free number for a large retailer, any of dozens of phones may answer. Arguably, then, all these phones have the same non-unique address. A more traditional application for non-unique addresses might be for reaching any of several equivalent servers or routers. 11. Video or audio teleconference transmissions among a reasonably large number of widely spread sites would be an excellent candidate unicast would require a separate connection between each pair of sites, while broadcast would send far too much traffic to sites not interested in receiving it. Trying to reach any of several equivalent servers or routers might be another use for multicast, although broadcast tends to work acceptably well for things on this scale. 12.

STDM and FDM both work best for channels with constant and uniform bandwidth requirements. For both mechanisms bandwidth that goes unused by one channel is simply wasted, not available to other channels. Computer communications are bursty and have long idle periods; such usage patterns would magnify this waste. FDM and STDM also require that channels be allocated and, for FDM, be assigned bandwidth well in advance. Again, the connection requirements for computing tend to be too dynamic for this; at the very least, this would pretty much preclude using one channel per connection. The answer is in the book. 20. a The effective bandwidth is 10 Mbps; the sender can send data steadily at this rate and the switches simply stream it along the pipeline.
