Top critical reviewAll critical reviews> Anna C.1.0 out of 5 starsUnfortunately it doesn't clean clothesReviewed in the United States on July 8, 2018I suppose you get what you pay for, but when my old, very basic model, cheap washer finally quit, I bought this one. I couldn't be more disappointed.Complain #1: the machine will not allow user to select load size, or water level. Instead, the washer is advertised as "auto-sensing," and will select the water level based on the "sensed" load size. But the only size it "senses" is extra large: place a small load of hand towels in it, and the machine will fill two-thirds of max capacity. Consequently, it wastes water and excessively dilutes the soap.Complain #2: the washer gently swirls clothing back and forth in its overfilled water tub. The agitator doesn't "agitate" vigorously enough to clean heavily soiled fabrics — I could clean my clothes more efficiently dipping them in a river.Complain #3: the washer locks once the rinsing cycle begins (it also locks during washing and spinning). I occasionally have to stop the cycle if I want to drop some liquid softener on the load. I also cannot restart a wash or time the wash cycle once it begins. The cycle has to be cancelled and started over. Certainly a minor inconvenience, nothing more, but as the laundry lord of my home, I like a machine I can fully control, even halfway through a wash, should my teenagers decide to throw in their stinky socks after I started laundry.If Amana wishes to offer a low end, cheap machine to its customers, I recommend skipping the attempts at fancy auto-sensors and automatic locks. Stick with the basics: let us choose the load size, temperature and cycle type, and all that's required of the washer is to obey the knob selection. Model Number LW9203W2 Brand Amana I just bought a house with a older model amana and our clothes come out of the wash covered in lint. I have changed the lint trap at the end of the drain hose and i have run a couple cycles with no clothes. Still no help. Is there a filter that I am not aware of that needs replacing?? Please help, wife is starting to mention new washer!! Yes, on this model you do have a lint filter, its under the inner tub. A common way to access the washer workings is here. Remove the screws at the bottom of the front panel, pull the bottom of the panel out to release it from the top. Remove two screws just inside the top front of the top panel and the top will tilt back. To remove the agitator.....The older washers have a bolt under the cap that must be removed to remove the agitator, then grab hold of the agitator and lift up. The newer washer agitator just pulls out, remove cap, if no bolt, just grab hold and lift up hard...picture.
